Preselected Files for Procedures in MultiRuns

Some of the procedures in MineSight® use **preselected** files which are the default **Project** files for each required file type. For a regular procedure, run those files as specified on the **Setup** tab dialog in MineSight® Compass™.

When setting up a **MultiRun Package**, you can optionally override the **preselected** files for any procedure in the package. Click on the **Files** button to the right of the **Procedure** name (shown circled in red). This will display a **MultiRun Files** dialog. To override a **preselected** file of a given type for all runs, select a file on the dialog panel.

To vary files as the **MultiRun Package** is executed, check the **Vary file** toggle (shown circled in blue). If you choose to vary files, then you will need to **specify** the files for each procedure run on the **Files** tab of the **MultiRun** dialog.

When importing a **MultiRun** from a different project, make sure that the files selected for each **Procedure** (in the original project, if any) exist in your project and are the files you want to use.
